                                                                                                                                                            8
                                                                                                                             Immunogenic hepatitis E virus (HEV) peptides are selected from the ORF1, ORF2 and ORF3 regions of HEV. The peptides can be used in vaccines to prevent infection by HEV. The antibodies can neutralise and block HEV infection and can be used to prevent or treat HEV infection. The peptides and antibodies can also be used as diagnostic reagents. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 24-OCT-2003 to standardise OS

This protein or peptide fragments of it may be used in a vaccine composition for immunising an individual against HEV. Antibodies raised against these peptides can also be used in such vaccines. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The putative capsid protein (AAR96089) of hepatitis E virus (HEV) Burma strain is encoded by ORF-2 (AAT27107) of the virus. PCR amplification of ORF-2 allows prodm. of capsid protein or of C-terminal regions of the capsid protein (see also AAR96091, AAR96099) and expression in Spodoptera frujiperda Sf9 insect cells using a baculovirus vector provides recombinant C-terminal regions (see also AAR96101 and AAR96103) useful as diagnostic reagents and in vaccines. The HEV Mexico strain capsid protein (AAR96099) may similarly be used. (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            40
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       9

A method has been developed for detecting hepatitis E virus (HEV) antibodies (Ab). The method comprises: (a) reacting a serum sample with a HEV peptide antigen; and (b) examining the peptide for the presence of bound Ab, where the presence of bound Ab indicates the presence of HEV Ab. The present sequence represents the protein from the open reading frame, ORF2, from HEV Burma strain. The method can be used to diagnose infection with the enterically transmitted non-A/non-B viral hepatitis agent HEV, specifically the HEV Burma and Mexico strains. (Updated on 25-MAR-2003 to correct PF field.) (Updated on 17-OCT-2003 to standardise OS field)
                                                Diagnosis of hepatitis E virus Burma and Mexico strain infection - by immunoassay with hepatitis E virus peptide antigens.
                                                                                                                          Disclosure; Col 39-42; 36pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 660 AA;

The specification describes an isolated protein which is specifically immunoreactive with antibodies present in individuals infected with HEV and encoded by a sequence contained in an open reading frame (ORF) of an HEV genome. The genome has a sequence that is more than 70% identical to the ORF1 sequence from Burma HEV isolate. The protein is used as a vaccine and a diagnostic probe for ET-NAMB. (Updated on 25-MAR-2003 to correct OR field.) (Updated on 27-AUG-2003 to correct OS field.)

mutants which are capable of cross reacting with antibodies reactive with a human HEV strain or natural mutants. The HEV and the proteins can be used in vaccines for immunising against HEV infection. The swine HEV can be used in vaccines for immunishing against HEV infection. The swine HEV can also be used as a therapeutic treatment for infection by other strains of HEV. The swine HEV can also be used as a therapeutic treatment for infection by other antibodies which can be used in therapy, detection and diagnosis. The products can also be used for determining the susceptibility of cells or organs to infection with swine HEV. The swine HEV is particularly useful for the development of agents for the prevention, treatment and detection of human HEV because it is not a human virus and thus can be handled both experimentally and clinically without fear of severe infection and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 40
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes a swine hepatitis E virus (HEV) and its natural

Identifying recombinant antigen immunoreactive with antibody induced by hepatitis E virus (HEV), for detecting HEV infection, comprises immunoreacting a polypeptide from an HEV genome with an HEV-positive antiserum.

Claim 6; Col 63-68; 46pp; English.

The present invention describes a method for identifying a recombinant antigen immunoreactive with a hepatitis B virus (HEV)-induced antibody. The method comprises producing a polypeptide derived from an HBV genome, immunoreacting the polypeptide with an HBV-positive antiserum and selecting the polypeptide as a recombinant antigen if the polypeptide reacts with the HBV-positive antiserum. The method is useful for identifying recombinant antigen immunoreactive with antibody induced by HBV. The enterically transmitted non-A/non-B hepatitis (ET-NANB (also known as HBV))-specific fragments are useful for identifying ET-NANB. Who contain additional sequence information, as primers for detecting ET-NANB viral genomic material in a patient sample, for the synthesis of polypeptides for use in immunoassays, and for identifying synthesis of polypeptides for use in immunoassays, and for identifying strains, the antigens are especially useful in the preparation of vaccine against ET-NANB infection. These antigens may further be used to prepare antibodies to ET-NANB virus particles for use directly as antiviral agents, and to produce antiserum designed for pre- or post-exposure prophylaxis. The present sequence represents a specifically claimed HEV Burma strain protein sequence for use in the present invention

The invention relates to an isolated DNA comprising the genome of an referrically transmitted nonA/nonB (ET-NANB) viral hepatitis agent (also referred as HEV). The DNA sequences or their fragments are useful in preparing ET-NANB viral proteins and as probes for virus detection. These are particularly useful in diagnosing infection by an enterically transmitted agent (e.g. ET-NANB virus), as well as in vaccine production. The Present sequence represents a ORF2 protein encoded by a ET-NANB viral DNA sequence from HEV-Burma strain
  in vaccine production.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PheTrpGlyAspArgValAspSerGlnProPheAla11eProTyr11eHisProThrAsn

The invention comprises a method for detecting the presence of enterically transmitted nonA/nonB hepatitis viral (HEV) agents in a sample and isolating HEV agents or nucleic acid fragments produced by the agent. The method utilises PCR - using bile from a human or cynomolgus monkey actively infected with HEV as a source of the agent. The method of the invention is used for detecting the presence of a viral agent in a sample of cultured cells infected with the agent and isolating enterically transmitted nonA/nonB HEV agents or nucleic acid fragments produced by the agent. The present amino acid sequence represents the protein encoded by open reading frame 2 (ORF2) of a DNA sequence isolated from a Burmese strain of the Hepatitis E virus
